

# Max

## Bank Elevator Displays

The Max is a flexible informational TFT indicator which can be customized for use in any building. This customization can reflect architectural elements, color schemes, and corporate identity. Within this customization, information can be presented to passengers regarding the elevator's current position, direction and status. They support up to 8 cars per screen, 5 messages per car and 6 messages per bank. The system is designed to take the interface from the machine room and add the data to the screen on a single twisted shielded pair plus a spare. Eliminating the need for costly multiconductor cable pulls.
