

C.E. Electronics recommends installing the DFC Sensor for the **Door Lock Monitoring System** horizontally with a 1/4" - 3/8" gap between the magnet and the sensor.

DFC Sensor Install Instructions

To prevent premature failure it is important to not put hard bends or extra strain on the wires where they connect to the sensor.

With the input of field technicians we have discovered one of the best ways to install these sensors is to mount the sensor bracket perpendicular to the doors and attach the magnet directly to the top of the door header with self-tapping screws. This may require modifying the mounting bracket to get the 1/4"-3/8" clearance.
